Neuroscience, and the Brain Research through Advancing Innovative Neureotechnologies (BRAIN) Initiative launched by the Obama Administration give rise to three critical ethical issues: the capacity for consent, questions of cognitive enhancement, and the use - and misuse - of neuroscience in the legal system.

These issues were highlighted in a recent report from the Presidential Commission for the Study of Bioethical Issues (PCSBI) titled Gray Matters: Topics at the Intersection of Neuroscience, Ethics, and Society.

Please join us for a half day series of panel discussions that address these issues, recommendations of the PCSBI and the current and future state of brain science.

With a wine and cheese reception to follow.

RSVP Katherine Shats at: ks1207@georgetown.edu
